

Vaccine Distribution Management Features & Benefits

Apptricity Vaccine Distribution Management program provides a comprehensive view of the population's health status and current inventory levels from a single vaccine distribution management system. This vaccine distribution management system helps make data-driven decisions and respond faster to your vaccine distribution needs.

The following are Apptricity Vaccine Distribution Management features that can help manage your vaccine distribution and inventory programs in real-time.

Vaccine Distribution Inventory Management

With vaccine distribution inventory management, program organizers can track the availability of vaccine doses and stock levels, monitoring lot numbers, expiration dates, and dose inventory. It can help maintain adequate vaccine doses.

This can also help forecast demand accurately by reducing waste, diverting surplus supplies in an area, and limiting supplies in another.

Vaccination Monitoring & Tracking

With easy data capture, government organizations can analyze and monitor the outcomes of vaccination distribution efficiently.

It helps plan a vaccination administration strategy and estimate the success rate of a vaccine. Organizations can respond to any widespread community health concern to vaccination faster.

Vaccine Administration

It helps capture vaccine inbound delivery information such as planning and forecasting accurately and prepares for vaccine receipt and outbound delivery administration. It monitors and tracks vaccine administration before vaccine delivery.

Besides, artificial intelligence and data analysis tools enable agencies to assess readiness and manage community health. Administration agencies can also maintain a log of vaccine administration, analyze vaccine results, and monitor them community-wide.

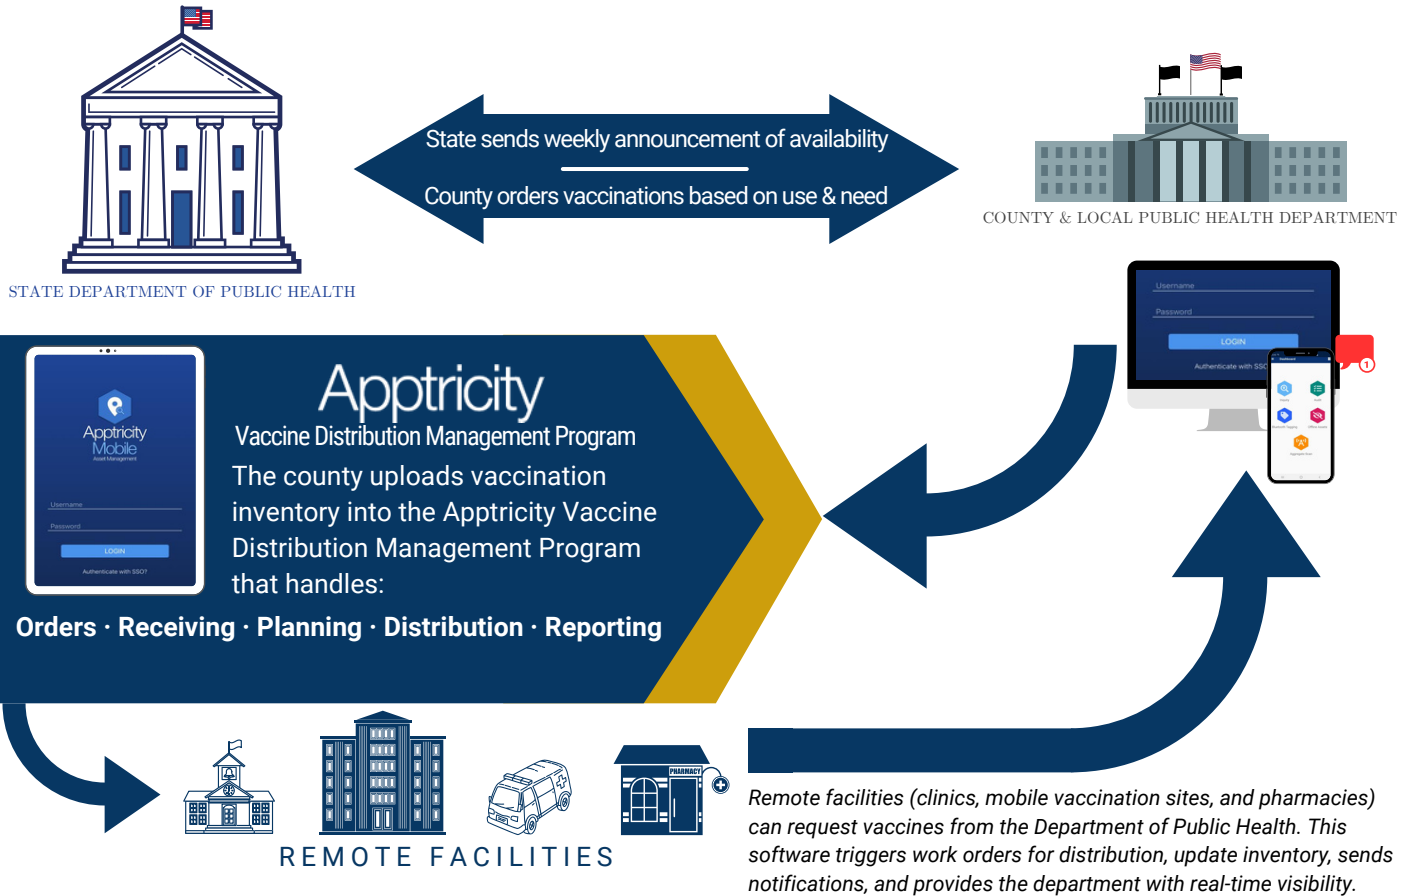

Reporting & Notifications

Vaccination reporting tools can show:

- Inventory Overview
- Projected Allocation
- Deliveries Received
- Future Deliveries
- Doses break-down (by dose received)
- Lot expiration report

Automating alerts like second-dose reminders, to-dos before vaccination, precautions, etc., can also reduce staff burden. Notifications can also alert site managers about when to re-stock based on the scheduled appointments.

Use Study for State & County Public Health Departments

THE APPTRICITY DIFFERENCE

We can help you streamline and automate all your vaccine distribution management issues. Vaccination distribution programs are in full swing in counties, states, and several countries worldwide. However, there is still a significant challenge in large-scale vaccination distribution management programs and scaling them efficiently.

Apptricity Vaccine Distribution Management program is an excellent government (city, county, and state) tool to have in your arsenal of tools to fight Covid-19. With consolidated data for all the aspects of vaccine management programs, it can help your government healthcare organizations increase productivity and availability.

If you are a government healthcare provider, the Apptricity Vaccine Distribution Management system can help you achieve your goals and objectives. Apptricity professionals will assess your requirements, make the necessary customizations in our Apptricity system, test it, and deliver you an automated solution.

With over 20 years of experience monitoring and tracking, you will receive the best products and services.
